Photoshop Quickstart Getting Started: Basic Tutorial A Brief History of Photoshop Adobe Photoshop is a powerful tool with one of the most robust feature sets available. It has stayed at the forefront of graphic design for a long time and because it has changed so little in its core architecture, its vast array of features will be just as powerful years from

now as it is today. Like other Adobe programs, Photoshop is copyrighted by its parent company, Adobe Systems. Although it started out as a monopoly, the US government forced it to open up its technology and Adobe was given permission to sell the software as well as license it for free. The more growth there is in the graphic design industry, the more important Photoshop becomes. Adobe claims that Photoshop can do anything you can possibly imagine, and it is absolutely true in a technical sense. But before you go out and get Photoshop and start creating a

masterpiece, it's important to understand how it works. This quick tutorial will help get you started, but if you want to really learn everything about Photoshop, check out a great book like Photoshop CS5 for Illustrators by Arnold Belk. To make things easier, this tutorial won't be as thorough as Belk's book, so it is meant to provide the basics necessary to get started creating an image to a level that will be comfortable for you. Just about everything you need to know about Photoshop can be found in this manual; just use the buttons on the side to jump to a certain section.

Creating a New Layer Before we get into the heart of the Photoshop learning curve, let's start by creating a simple image we'll use throughout this tutorial. We'll make it black and white in order to contrast with the colors we'll apply later on. To do this, go to File | New and click on Layer. Make sure Fill is selected and click OK. This will create a new layer with the default settings. When you go to the Layers Palette, you'll see that the layer has only one option – Fill. The default black and white fills, Horizontal and Vertical will get the job done. But before you go using

one of these in Photoshop, go to Image | Adjustments | Curves and change the settings to something you can use to tweak the image. With the settings I've chosen, the background is in the upper third and the highlight is in the lower third of the image. Now

variety of adjustments Use the built-in image editor to make basic edits Photoshop is the most widely used graphics editor for photos. It is used for most types of photo editing. Photoshop Elements is a great alternative to Photoshop because it is just as powerful, but with a more streamlined user interface. In this post, I'll show you how to use Photoshop Elements to edit and organize your photos. Personally, I prefer to use Photoshop Elements. I've found it to be less intimidating than Photoshop and so I'm able to make more effective edits.

You are here July and August are prime times to carpool to produce more energy while sharing gas dollars among its many members As populations continue to expand throughout the United States, carpooling across the country has become a viable option to commuting alone. In a poll conducted in 2008 by the National Household Travel Survey (NHTS) for the U.S. Department of Transportation, 93 percent of Americans surveyed said they carpool to some degree. The U.S. Census

Bureau estimates that in the United States, 35 percent of all trips are taken by an automobile. If we use that figure as a measure of transportation utilization, then we can assume that approximately 88 billion trips are taken each year in the U.S. by car. Further, if we use the census data on household vehicle ownership, we can assume that a typical household drives four cars. Based on this, if we can reduce the number of trips taken by an average car and reduce the amount of fuel used per trip by one gallon, we can assume that the carpooling reduces overall fuel use by around 4

billion gallons. This equates to approximately four billion fewer gallons of gasoline needed in the U.S. annually to fuel cars. The number of carpooling trips taken in the United States amounts to approximately 180 million trips each year. If we assume a trip of 20 miles one-way from home to work, then using a round figure of 30 miles per carpool, we can assume that each carpool consists of approximately six people (five members and the driver). Based on this, one car could provide transportation for approximately 18,000 carpool trips per year. Are you

ready for July and August? You are right on track to improve your carbon footprint and reduce your energy needs this summer by making an effort to carpool to work, school, vacation and sporting events throughout these two months. There are actually two benefits to carpooling: In terms of reducing your carbon footprint by reducing your emissions, carpooling is by far the most efficient way to use vehicle trips. Therefore, when you carpool, you are effectively using two vehicles on a single trip instead of having to acquire and operate two vehicles.

Carpooling across the country, especially during the summer, provides a boost to the economy by creating additional transportation demand. By carpooling to work, you can use one of these two benefits in July and August, and it will help save you money

Enhancing the Therapeutic Effect of Paclitaxel by Targeting Tumor-Associated Neutrophil in Lung Cancer Xenografts. Tumor-associated neutrophils (TANs) are a subset of

immune cells that promote angiogenesis, immune escape, metastasis, and resistance to chemotherapy. However, the potential role of TANs in paclitaxel-based chemotherapy remains unknown. We investigated the association between TANs and the therapeutic effect of paclitaxel in non-small cell lung cancer. To evaluate the in vivo role of TANs in paclitaxel therapy, we generated a lung cancer xenograft model using Capan-1 cells that were stably transfected with an mCherry construct, which permitted tracking of TANs. These cells were inoculated

into the tail veins of female nude mice, which were randomly assigned to one of the three following groups: (1) paclitaxel, paclitaxel-associated TANs depletion, and paclitaxel-associated neutrophils infiltration; (2) control, tumor-cell inoculation alone; or (3) vehicle, empty vector-cell inoculation alone. Tumor growth, apoptosis, necrosis, microvessel density, tumor-induced angiogenesis, and chemosensitivity to paclitaxel were measured and compared between groups. After 21 days, mice in the paclitaxel group exhibited slower tumor growth compared with

mice in the control group, with fewer vasculature and fewer TANs. This paclitaxel-mediated therapeutic effect was inhibited by neutrophil depletion. Furthermore, conditioned media from TANs induced endothelial cell tube formation, but not monocytes. TANs affect paclitaxel-mediated tumor inhibition in vivo, and this effect may be mediated by the TAN-induced endothelial cell tube formation.Q: What is the cost of only collecting a dimen.xml from AppSettings once?
